## ACP LAUNCHES NEW “PRO SERIES” THERAPEUTIC MODALITY LINE WITH EVIDENCE-BASED, “CONDITION-DRIVEN” OPERATION FOR IMPROVED OUTCOMES AND EASE-OF-USE

**October 1, 2007 - Reno, Nevada** - Accelerated Care Plus Corp. (ACP) announced today, the introduction of a new line of therapeutic modality devices called the “Pro Series.” Continuing ACP’s heritage for innovation and “outcomes-driven” design, the Pro Series introduces yet another level of clinical integrity, reliability and ease-of-use through a variety of new features.

This new product line includes Electrotherapy (Omnistim® 500 Pro), Patterned Electrical Neurostimulation-PENS (Omnistim® FX<sup>2</sup> Pro and Omnistim® FX<sup>2</sup> Pro “Sport”), Ultrasound (Omnisound® 3000 Pro), Short wave Diathermy (Megapulse® II Pro) and an Infrared Therapy and E-stim Combo Unit with Hand Probe (Neuroprobe® 500B). Each of these devices now offers pre-set parameters with protocol-driven operation allowing therapists to quickly treat to specific conditions in a few quick steps. These pre-set parameters can be adjusted as needed to accommodate individual patient response. In addition, the new Pro Series devices include a larger menu display, improved durability and a “smooth-finish” control panel membrane for enhanced infection control. A hand remote has also been integrated into the Omnistim® 500 Pro and Omnistim® FX<sup>2</sup> Pro for therapist or patient prompted “sit-to-stand” functional muscle rehabilitation and other assisted therapy needs.

Developed specifically for sports rehabilitation and athletic trainers, the Omnistim® FX<sup>2</sup> Pro “Sport” features new pre-set “condition-driven” protocols for sports-related clinical applications. The Pro Sport uses ACP’s patented waveform called PENS (Patterned Electrical Neurostimulation) that closely replicates the live-firing pattern of muscles to promote nerve and muscle reeducation following injury, surgery or muscle disuse atrophy.

“Perhaps more than other companies, we go to great lengths to anchor our product development efforts in evidence-based science,” said ACP’s Chief Technology Officer, Chris Castel PhD. “That’s critical, but what also differentiates us from other physical modality manufacturers is that ACP’s devices are developed by clinicians... for clinicians. This approach typically leads to superior clinical efficacy and at the same time, medical technology that can better meet the needs of clinicians in real world rehabilitation settings.

Over the past 30 years ACP has been responsible for numerous innovations and patents. The Company’s therapeutic equipment is well researched, with over 100 scientific articles documenting superior outcomes and safety. During that period, ACP’s medical technology has been used safely and successfully in a variety of therapy settings and is currently the “equipment of choice” for over 100 professional and collegiate sports teams. The devices are used by clinicians in this therapy setting to accelerate healing, improve functional outcomes and enhance performance.

“Progressive medical technology is only useful insofar as it serves the unique needs of practitioners and the patients they’re serving,” stated Castel. “The new Pro Series is a great example of that philosophy in action.”

**About Accelerated Care Plus (ACP)** – Accelerated Care Plus (ACP) is one of the world’s leading providers of advanced therapeutic modalities. ACP offers a full-line of patented devices including Electrotherapy, Patterned Electrical Stimulation (PENS), Ultrasound, Shortwave Diathermy, Infrared Therapy and a Motor-Assist Therapeutic Cycling System. ACP also serves over 2400 skilled nursing facilities and other rehabilitation providers throughout the U.S. with its comprehensive modality-based clinical programs. Accelerated Care Plus was originally founded in 1996 and is headquartered in Reno, Nevada.
