Improving Quality of Life with Orthotic Therapies

Orthotics are used to help support, protect or correct problems patients may have with their joints, limbs or other parts of the body. Orthotics may be used to help treat conditions such as arthritis, contractures, stroke, injury, post-joint surgery and pain.

Orthotic treatments may include the use of medical technology called “Therapeutic Modalities,” such as ultrasound, shortwave diathermy, and gentle electrical stimulation. Medical research shows that Therapeutic Modalities can enhance the benefits of orthotics with certain conditions.

Comfortable Protection, Correction and Support for a Wide Range of Conditions

Our orthotic treatment plans are developed around specific goals based on the patient's condition. These goals may include increasing range of motion, supporting a weakened body part, or providing more stability to healing joint tissues after surgery.

Many common conditions and symptoms may benefit from orthotics and our specialized treatment program:

- Pain
- Contractures
- Rheumatoid arthritis
- Osteoarthritis
- Muscle weakness
- Coordination or balance problems
- Recovery from a joint replacement
- Recovery from a stroke
- Loss of movement
- Post-surgical recovery
- Carpal tunnel syndrome

Advanced Medical Technology

Our specialized orthotic braces and supports have been used safely and effectively among people of all ages. These lightweight devices are easy to use and comfortable to wear. Some orthotics use specialized air bladders or gel pads to provide gentle, cushioned stretch and support.

Progressive Rehabilitation Techniques

Our therapists have received special training in the use of orthotic devices, including proper selection and fitting. They are also trained in the use of Therapeutic Modalities with orthotics to help improve treatment results.

How Our Programs Work

You or your loved one will be evaluated by one of our specially trained therapists. They may evaluate things like range of motion, strength, coordination, balance and the ability to perform certain activities. A customized treatment plan will then be developed for the individual's specific needs and goals.
